

Influenza Surveillance Report

Division of Epidemiology - Disease Surveillance and Investigation
District of Columbia Department of Health

2018-2019 Influenza Season Week 5 (January 27, 2019 – February 2, 2019)

(All data are preliminary and may change as more reports are received)

SUMMARY

- 120 new cases of influenza were reported by hospitals
- Zero pediatric deaths were reported
- To date, 496 influenza cases have been reported for the 2018-2019 influenza season
- No specimens were submitted to DC Public Health Laboratory for testing during week 5
- Flu activity increased since last week and remains elevated

INFLUENZA SURVEILLANCE FROM DC HOSPITALS & AMBULATORY CARE FACILITIES

District of Columbia (DC) hospitals report detailed information on cases of influenza on a regular basis. In accordance with CDC guidelines, influenza-associated deaths in cases <18 years of age and novel influenza A infections are notifiable diseases. In addition to this, the DC Department of Health (DC Health) requests that influenza hospitalizations be reported whenever possible.

The table below summarizes weekly and cumulative cases of influenza for the 2018-2019 Season. Data are also presented by age group and by number of cases reported weekly. During week 5 (January 27th, 2019 – February 2nd, 2019), there were 120 new cases of influenza reported. A total of 644 tests were performed during week 5. To date, there are 496 positive influenza cases reported by all nine hospitals in DC.

Surveillance of Influenza Cases Reported By Influenza Type

	Week 5 (Jan 27, 2019- Feb 02,2019)		Cumulative Positive Cases for Weeks 40–20 (September 30, 2018–May 18, 2019)	
	Count	Percentage	Count	Percentage
Influenza A	114	(95.00%)	448	(90.34%)
Influenza B	3	(2.50%)	27	(5.44%)
Influenza A/B	0	(0.00%)	10	(2.01%)
Influenza (not typed)	3	(2.50%)	11	(2.21%)
Total	120*	(100.00%)	496*	(100.00%)

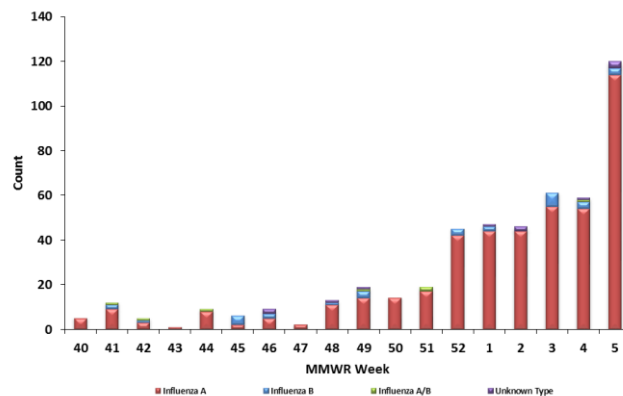

*Includes results from Rapid Diagnostic Testing, Viral Culture, RT-PCR, Serology, and Immunofluorescence.

**Age groups are classified as 1(0-4 years), 2 (5-24 years), 3(25-64 years), 4 (>64 years) & 5 (age not specified)

Positive Influenza Tests, by Age Group
Week 5 (27thJan19-2ndFeb19)

Positive Influenza Tests by Reporting Week
September 30, 2018- February 2, 2019

RAPID DIAGNOSTIC TESTING

Rapid Diagnostic Tests are point-of-care screening tests used to detect influenza virus. While initially less accurate than PCR and viral culture, rapid diagnostics are more accurate as the influenza season progresses. During week 5, 233 out of a total of 644 tests were performed using rapid diagnostic testing in clinical laboratories. Of these, 38(16.30%) were identified as positive using rapid diagnostics.

Week: 5 (January 27, 2019 – February 2, 2019)	
No. of specimens tested Rapid Diagnostics	233
No. of positive specimens (%)	38 (16.30%)
Positive specimens by type/subtype	
Influenza A	33(86.85%)
Influenza B	2 (5.26%)
Influenza A/B	0 (0.00%)
Influenza – unknown type	3 (7.89%)

WEEK 5 COMPARISON WITH PREVIOUS SEASONS

For week 5, there were 120 new influenza cases reported in the current season, 339 in the previous 2017-2018 season, 147 cases in the 2016-2017 season, 10 cases in the 2015-2016 season, 40 in the 2014-2015 season, 53 in 2013-2014 and 37 in the 2012-2013 season.

Cumulatively, there are a total of 496 cases reported up to week 5 for the current season. For the previous seasons, 1491 cases were reported during the 2017-2018 season, 602 during the 2016-2017 season, 107 in the 2015-2016 season, 636 in the 2014-2015 season, 468 in 2013-2014 season and 609 in the 2012-2013 season.

INFLUENZA-LIKE ILLNESS (ILI) SURVEILLANCE

Sentinel surveillance for ILI consists of six outpatient reporting sites for the District of Columbia. The sentinel surveillance sites report the total number of ILI cases encountered per week and the total number of patients seen at the clinic during that same week. For this system, ILI is defined as the existence of fever (temperature of 100°F [37.8°C] or greater) and a cough and/or a sore throat in the absence of a known cause other than influenza.

For week 5, sentinel providers reported 452 out of 14168 visits (3.19%) that met the criteria for ILI.

Geographic Spread of Influenza for Washington, DC

Week of	Activity *
Jan 27 – Feb 02	Local

- *No Activity** – overall clinical activity remains low and there are no lab confirmed Influenza cases;
- Sporadic** – isolated lab confirmed Influenza cases reported and ILI activity is not increased;
- Local** – increased ILI activity and recent lab confirmed Influenza cases. As the District of Columbia is not a state, this is the highest level of ILI activity it can report.

INFLUENZA TESTING BY THE DISTRICT OF COLUMBIA PUBLIC HEALTH LABORATORY (DC PHL)

The DC PHL subtypes human isolates to monitor the circulating strains of Influenza. The isolates are submitted to DC PHL by hospitals and commercial laboratories on a regular basis. The DC PHL has completed testing for a total of 545 specimens this season.

DC PHL Surveillance of Influenza Cases Reported By Influenza Subtype*

DC PHL Influenza Testing	Jan 27, 2019 – Feb 02, 2019	Sep 30, 2018 –Jan 26, 2019
Number of specimens tested	0	545
Number of positive specimens	0	22
Influenza A	0(0.00%)	22 (100.0%)
A(H1N1)pdm09	0	18
H3N2	0	4
Influenza B	0 (0.00%)	0 (0.00%)
Yamagata lineage	0	0
Victoria lineage	0	0

NATIONAL INFLUENZA ASSESSMENT

Influenza activity increased in the United States. Influenza A (H1N1) pdm09, Influenza A (H3N2), and influenza B viruses continue to co-circulate. The proportion of deaths attributed to pneumonia and influenza (P&I) was below the system-specific epidemic threshold. Four influenza-associated pediatric deaths were reported to CDC during week 5. Two deaths were associated with influenza A virus for which no subtyping was performed and occurred during weeks 4 and 5. Two deaths were associated with an influenza A (H1N1) virus and occurred during weeks 4 and 5. A total of 28 influenza-associated pediatric deaths have been reported for the 2018-2019 season. During week 5, 1442 specimens were tested by public health laboratories, of which 843 were positive. Of the 843 respiratory specimens that tested positive during week 5, 829 (65.0%) were Influenza A and 14 (1.7%) were Influenza B. Of the Influenza A samples, 524 (65.0%) were 2009 H1N1, 282 (35.0%) were H3N2, and no subtyping was performed for 23 specimens.

Influenza Positive Tests Reported to CDC by U.S. Public Health Laboratories, National Summary, 2018-2019 Season
